

Description

The 5P35023 is a VersaClock programmable clock generator and is designed for low-power, consumer, and high-performance PCI Express applications. The 5P35023 device is a three PLL architecture design, and each PLL is individually programmable and allowing for up to six unique frequency outputs.

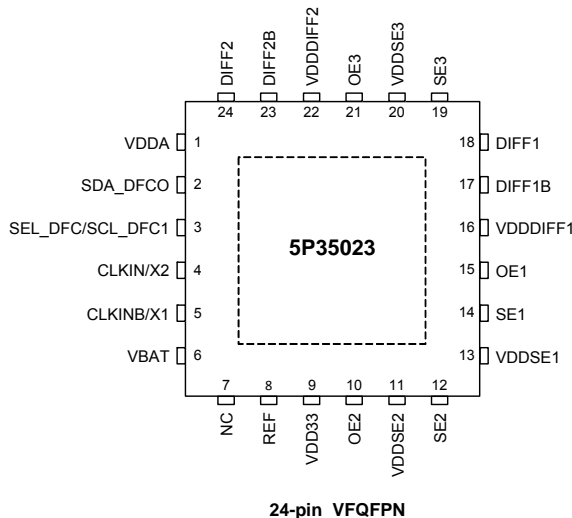

The 5P35023 has built-in unique features such as Proactive Power Saving (PPS), Performance-Power Balancing (PPB), Overshot Reduction Technology (ORT) and Extreme Low Power DCO. An internal OTP memory allows the user to store the configuration in the device. After power-up, the user can change the device register settings through the I²C interface when I²C mode is selected.

The device has programmable VCO and PLL source selection to allow the user to do power-performance optimization based on the application requirements. It also supports three single-ended outputs and two pair of differential outputs that support LVCMOS, LVPECL, LVDS and LPHCSL. A low-power 32.768kHz clock is supported with only less than 2μA current consumption for system RTC reference clock.

Typical Applications

- PCIe Gen1/2/3 clock generator
- Consumer application crystal replacements
- SmartDevice, Handheld, Computing and Consumer applications

Pin Assignment

Features

- Configurable OE pin function as OE, PD#, PPS or DFC control function
- Configurable PLL bandwidth/minimizes jitter peaking
- PPS: Proactive Power Saving features save power during the end device power down mode
- PPB: Performance- Power Balancing feature allows minimum power consumption base on required performance
- DFC: Dynamic Frequency Control feature allows user to dynamically switch between and up to 4 difference frequencies smoothly
- Two PLLs support independent spread spectrum clocks to lower system EMI
- Store user configuration into OTP memory
- I²C interface

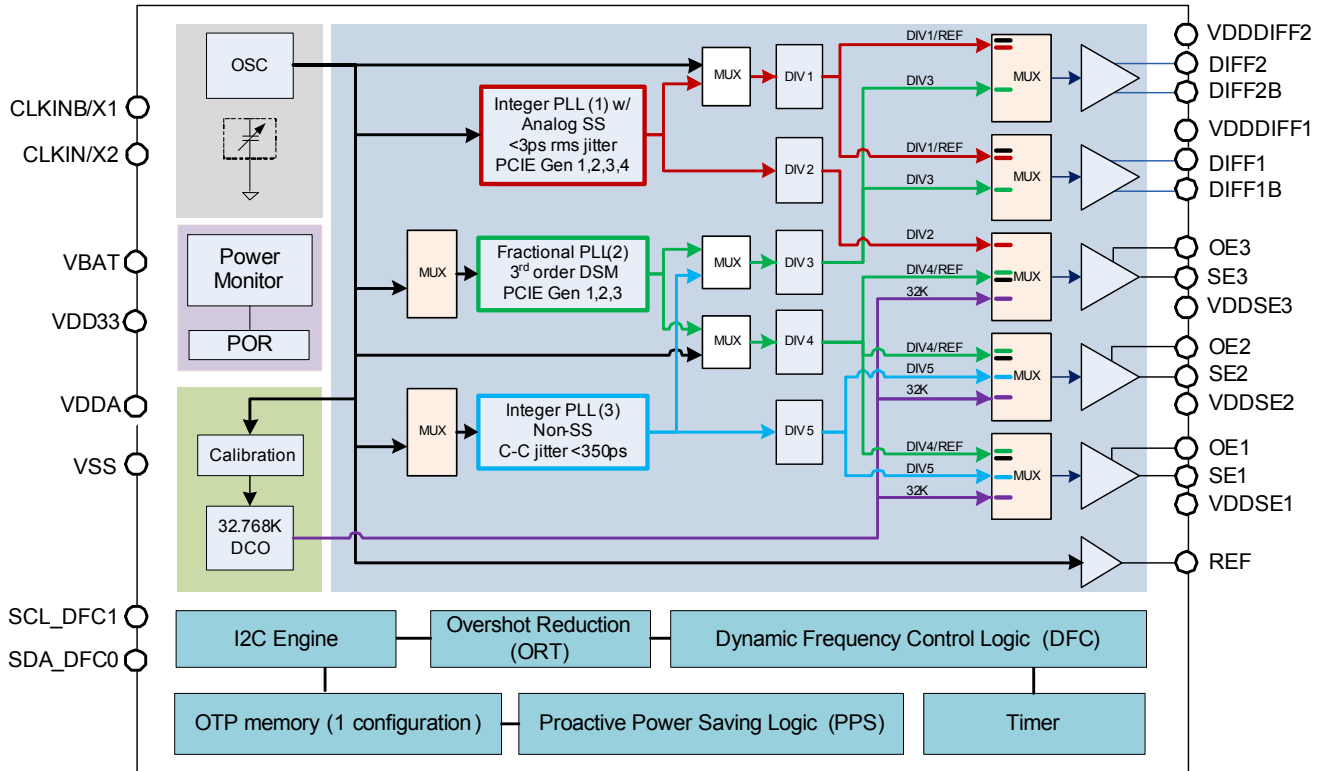

Key Specifications

- PCIe Gen 1/2/3 compliant
- Differential clocks <1.5 ps rms jitter integer range 12KHz–20MHz
- <2μA RTC clock in suspend mode operation

Output Features

- 2 DIFF outputs with configurable LPHSCL, LVDS, LVPECL, LVCMOS output pairs. 1MHz–500MHz (160MHz/ with LVCMOS mode)
- 3 LVCMOS outputs; 1MHz–160MHz
- Maximum 8 LVCMOS outputs as REF + 3 × SE + 2 × DIFF_T/C as LVCMOS
- Low Power 32.768kHz clock supported for all SE1–SE3

Glossary of Features

Term	Function Description	Apply to
DFC	Dynamic Frequency Control, from selected PLL to support four VCO frequencies, means two different output frequencies by assign H/W pin state changes	PLL2
ORT	Over Shot Reduction, when the DFC dynamic frequency change is functional, the VCO change frequency smoothly to target frequency without overshoot or under shoot.	PLL2
OE	Output Enable function, each output can be controlled by assigned OE pin, the dedicated OE pin can be OTP programmable as Global Power Down function (PD#) or Output enable (OE) or proactive power saving function (PPS) or RESET pin function.	OE1~3
SS	Spread Spectrum clock	PLL1/PLL2
Slew Rate	LVC MOS outputs with slew rate control - slow and fast.	LVC MOS
PPS	Proactive Power Saving, utilize OE pin as monitor pin for end device X2 clock status, details see PPS function description	SE1~3

Pin Descriptions

Number	Name	Type	Description
1	VDDA	Power	VDD 3.3V
2	SDA_DFC0	I/O	I2C DATA pin, the pin can be DFC0 function by pin3 SEL_DFC power on latch status
3	SEL_DFC/SCL_DFC1	Input	I2C CLK pin, SEL_DFC is a latch input pin during the power up High on power on: I2C mode as SCLK function, Low on power on: pin3 SCL and pin2 SDA as DFC function control pins.
4	CLKIN/X2	I/O	Crystal Oscillator output or Differential clock input pin (CLKIN)
5	CLKINB/X1	Input	Crystal Oscillator input or Differential clock input pin (CLKINB) or single-ended clock input
6	VBAT	Power	Power supply pin for 32.768KHz DCO, usually connect to coin cell battery, 3.0~3.3V
7	NC	NC	NC
8	REF	Output	3.3V Reference clock output
9	VDD33	Power	VDD 3.3V
10	OE2	Input	Output enable control 2, multi-function pin. Refer to OE function table.
11	VDDSE2	Power	Output power supply. Connect to 1.8 to 3.3V. Sets output voltage levels for SE2.
12	SE2	Output	Output Clock SE2.
13	VDDSE1	Power	Output power supply. Connect to 1.8 to 3.3V. Sets output voltage levels for SE1.
14	SE1	Output	Output Clock SE1.
15	OE1	Input	Function selected from OTP preprogram register bits. pull to 6.5V when burn OTP registers. Refer to OE function table for details
16	VDDDIFF1	Power	Output power supply. Connect to 2.5 to 3.3V. Sets output voltage levels for DIFF1.
17	DIFF1B	Output	Differential clock output 1_Complement, can be OTP pre-program to LVCMOS/LPHCSL/LVDS/LVPECL output type
18	DIFF1	Output	Differential clock output 1_True, can be OTP pre-program to LVCMOS/LPHCSL/LVDS/LVPECL output type
19	SE3	Output	Output Clock SE3.
20	VDDSE3	Power	Output power supply. Connect to 1.8 to 3.3V. Sets output voltage levels for SE3.
21	OE3	Input	Output enable control 3, multi-function pin. Refer to OE function table.
22	VDDDIFF2	Power	Output power supply. Connect to 2.5 to 3.3V. Sets output voltage levels for DIFF2.
23	DIFF2B	Output	Differential clock output 2_Complement, can be OTP pre-program to LVCMOS/LPHCSL/LVDS/LVPECL output type
24	DIFF2	Output	Differential clock output 2_True, can be OTP pre-program to LVCMOS/LPHCSL/LVDS/LVPECL output type
ePAD		Power	Connect to ground pad.

Device Feature and Function

DFC–Dynamic Frequency Control

- OTP program (Only) setup 4 different feedback fractional divider (4 VCO frequencies) that apply to PLL2
- ORT (over shoot reduction) function will be applied automatically during the VCO frequency change
- Smooth frequency incremental or decremental from current VCO to targeted VCO base on DFC hardware pins selection

1	00~10	00~10	1	W30[1:0]	I2C control DFC mode

DFC Function Programming

- Register B63b3:2 select DFC00~DFC11 configuration.
- Byte16~19 are the register for PLL2 VCO setting, based on B63b3:2 configuration selection, the data write to B16~19 will be store in selected.
- Refer to DFC function priority table, select proper control pin(s) to activate DFC function.
- Note the DFC function can also be controlled by I2C access.

PPS–Proactive Power Saving Function

PPS Proactive Power Saving is an IDT patented unique design for the clock generator that proactively detects end device power down state and then switches output clocks between the normal operation clock frequency and the low power mode 32KHz clock that only consume <math><2\mu\text{A}</math> current. The system could save power when the device goes into power down or sleep mode. The PPS function diagram is shown below.

PPS Function Block Diagram

PPS Assertion/Deassertion Timing Chart

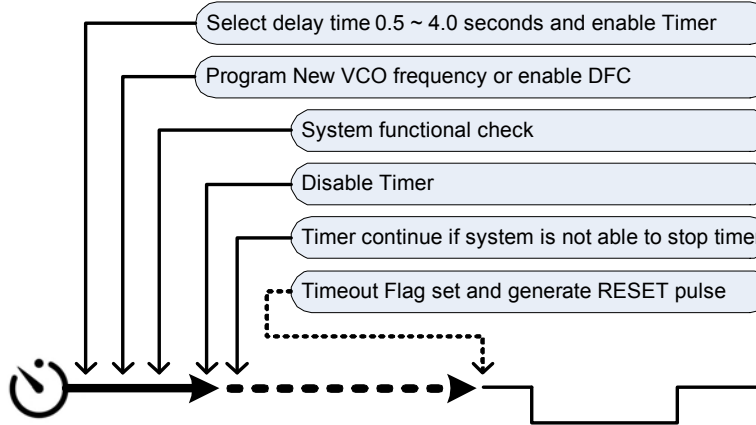

PPS Function Programming

- Refer to OE_pin_function_table to have proper PPS function selected for OE pin(s), please note that register default is set to Output enable (OE).
- Have proper setup to Byte 30 and 32 for OE1~OE3 function selection, for PPS function, select 10 to control register bits.

Timer Function Description

1. The timer function can be used together with the DFC -Dynamic Frequency Control function or with another PLL frequency programming.
2. The timer provides 4 different delay times as 0.5 sec - 1 sec - 2 sec - 4 sec by two bits selection.
3. The timeout flag will be set when timer times out, and the flag can be cleared by writing 0 to timer enable bit.
4. When timer times out, RESET pin can generate a 250ms pulse signal if RESET control bit is enabled.
5. When timer times out, DFC stage will switch back to DFC00 setting if DFC function is enabled and DFC function will be disabled after RESET.

OE Pin Function

OE pins in the 5P35023 have multiple functions. The OE pins can be configured as output enable control (OE) or chip power down control (PD#) or Proactive Power Saving function (PPS). Furthermore, the OE pins can be configured as single or two pin dynamic Frequency control (DFC), or the RESET out function that is associated with the Timer function.

OE Pin Function Summary

OE1: SE1	OE1 only control SE1 enable/disable, other outputs are not affected by this pin status
OE2: SE2	OE2 only control SE2 enable/disable, other outputs are not affected by this pin status
OE2: SE3	OE3 only control SE3 enable/disable, other outputs are not affected by this pin status
OE2: DIFF1/DIFF2	OE2 control Differential outputs 1 and 2 only, other SE outputs are not affected by this pin status
OE1: PD#	OE1 control chip global power down (PD#) except 32.768kHz on OE1 (when 32K is enabled), When the PD# pin is active low, the chip goes to lowest power down mode and all outputs are disabled except 32kHz output and only keep 32k/Xtal calibration.
OE1: SE1_PPS	Config OE1 as SE1_PPS (Proactive Power Saving) function pin
OE2: SE2_PPS	Config OE2 as SE2_PPS (Proactive Power Saving) function pin
OE3: SE3_PPS	Config OE3 as SE3_PPS (Proactive Power Saving) function pin
OE1:DFC0	Config OE1 as DFC0 control pin0
OE3:DFC1	Config OE3 as DFC1 control pin1

Reference Input and Selection

By programming, the 5P35023 accepts 8MHz ~40MHz crystal input, 8MHz to 125MHz differential clocks input or 1MHz ~125MHz LVCMOS (to X1) input. See below reference circuit for details.

Crystal Input (X1/X2)

The crystal oscillators should be fundamental mode quartz crystals; overtone crystals are not suitable. Crystal frequency should be specified for parallel resonance with 40MHz maximum.

A crystal manufacturer will calibrate its crystals to the nominal frequency with a certain load capacitance value. When the oscillator load capacitance matches the crystal load capacitance, the oscillation frequency will be accurate as 0 PPM. When the oscillator load capacitance is lower than the crystal load capacitance, the oscillation frequency will be higher than nominal. In order to get an accurate oscillation frequency, the matching the oscillator load capacitance with the crystal load capacitance is required.

To set the oscillator load capacitance, 5P35023 has built-in two programmable tuning capacitors inside the chip, one at XIN and one at XOUT. They can be adjusted independently. The value of each capacitor is composed of a fixed capacitance amount plus a variable capacitance amount set with the XTAL[7:0] register. Adjustment of the crystal tuning capacitors allows for maximum flexibility to accommodate crystals from various manufacturers. The range of tuning capacitor values available are in accordance with the following table.

Programmable Tuning Caps Table

Parameter	Bits	Range	Min (pF)	Max (pF)
Xtal [7:0]	4*2	+1/+2/+4/+8 pF	0	15pF

$$XTAL[4:0] = (XTAL CL - 7pF) * 2 \quad (Eq.1)$$

Equation 1 and the table of XTAL[7:0] tuning capacitor characteristics show that the parallel tuning capacitance can be set between 4.5pF to 12.5pF with a resolution of 0.25 pF.

For a crystal $CL = 8pF$, where CL is the parallel capacity specified by the crystal vendor that sets the crystal frequency to the nominal value. Under the assumptions that the stray capacity between the crystal leads on the circuit board is zero and that no external tuning caps are placed on the crystal leads, then the internal parallel tuning capacity is equal to the load capacity presented to the crystal by the device.

The internal load capacitors are true parallel-plate capacitors for ultra-linear performance. Parallel-plate capacitors were chosen to reduce the frequency shift that occurs when non-linear load capacitance interacts with load, bias, supply, and temperature changes. External non-linear crystal load capacitors should not be used for applications that are sensitive to absolute frequency requirements.

Spread Spectrum

The 5P35023 supports spread spectrum clocks from PLL1 and PLL2; the PLL1 built-in with Analog spread spectrum and PLL2 has Digital spread spectrum.

Analog Spread Spectrum

Please refer to programming guide.

Digital Spread Spectrum

$$N = \frac{F_{vco}}{2 * F_{out}}$$

$$period = \frac{F_{pfd}}{2 * F_{ss}}$$

$$step = \frac{N * SS_{amout}}{period}$$

Down spread or Spread off

$$N = F_{vco}/F_{pfd}$$

Center Spread

$$N = N_{ssoff} + N * SS_{amount}/2$$

N: include integer and fraction

F_{vco}: vco's frequency

F_{pfd}: PLL's pfd frequency

F_{ss}: spread modulation rate

SS_{amout}: spread percentage

The black line is for the down spread, N will decrease to make the center frequency is lower than spread off.

The blue line is for the center spread, there is a offset put on divider ratio to make the center frequency keep same as spread off

example: 0.5% down spread at 32kHz modulation rate

Suspend Mode with RTC Clock Only

VersaClock 3S can operate in two modes:

- Full-power mode:

— Full chip active with the most functionality and all V_{DDs} are connected to power supply.

- Low-power Suspend Mode:

— Device power-up with below sequence:

1. V_{BAT} and all other V_{DDs} are powered up. V_{BAT} ramp must be earlier or same time as other V_{DD}.

2. After full power-up is completed, the device can go into Suspend Mode; triggered when V_{BAT} is powered and rest of the V_{DDs} ramped down (ramp-down time slower than 3ms).

In Suspend Mode, the device will operate with a 2μA core power with only V_{BAT} powered up, producing 32kHz outputs on SEx outputs (it can be multiple copies). Operating at this state helps the system in power-down or sleep-mode without losing date-time information at a very low-power budget. During system wake-up, the device will revert to full-power mode automatically and produce outputs upon user configuration.

When core power is present (V_{DD33} and V_{DDA}), the device will switch DCO supply to core power to save battery power.

V_{BAT} Switching Threshold

V _{DD33}	V _{BAT}	DCO power source
>2.5V	--	V _{DD33}
<2.3V	--	V _{BAT}

*V_{BAT} needs to be 3.0V~3.3V

ORT-VCO Over-shoot Reduction Technology

The 5P35023 supports innovate the VCO over-shoot reduction technology (ORT) to prevent an output clock frequency spike when the device is changing frequency on the fly or doing DFC (Dynamic Frequency Control) function. The VCO frequency changes are under control instead of free-run to targeted frequency.

Absolute Maximum Ratings

Stresses above the ratings listed below can cause permanent damage to the 5P35023. These ratings, which are standard values for IDT commercially rated parts, are stress ratings only. Functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods can affect product reliability. Electrical parameters are guaranteed only over the recommended operating temperature range.

Note 1: Guaranteed by design and characterization. Not 100% tested in production

Note 2: Measured from differential waveform.

Note 3: Slew rate is measured through the VSWING voltage range centered around differential 0V. This results in a +/-150mV window around differential 0V.

Note 4: VCROSS is defined as voltage where Clock = Clock# measured on a component test board and only applies to the differential rising edge (i.e. Clock rising and Clock# falling).

Note 5: the total variation of all VCROSS measurements in any particular system. Note that this is a subset of VCROSS min/max (VCROSS absolute) allowed. The intent is to limit VCROSS induced modulation by setting ΔVCROSS to be smaller than VCROSS absolute.

Note 6: Measured from single-ended waveform.

Note 7: Measured with scope averaging off, using statistics function. Variation is difference between min. and max

Note 8: Scope average ON

DC Electrical Characteristics for LVDS

1. Practical lower frequency is determined by loop filter settings.

2. Includes loading the configuration bits from EPROM to PLL registers. It does not include EPROM programming/write time.

3. Actual PLL lock time depends on the loop configuration.

4. * SE2/SE3 are not available in 5P35021, only available in 5P35023 QFN24 device

5. t₄ Rise/Fall time measurements are based on 5pF load

6. t₅ Rise/Fall time measurements are based on 2pF load

PCI Express Jitter Specifications

Unless stated otherwise, $V_{DDIFF} = 3.3\text{ V} \pm 5\%$ or $2.5\text{ V} \pm 5\%$, $T_A = -40^\circ$ to $+105^\circ\text{C}$

Note: Electrical parameters are guaranteed over the specified ambient operating temperature range, which is established when the device is mounted in a test socket with maintained transverse airflow greater than 500 lfm. The device will meet specifications after thermal equilibrium has been reached under these conditions.

1. Peak-to-Peak jitter after applying system transfer function for the Common Clock Architecture. Maximum limit for PCI Express Gen 1.
2. RMS jitter after applying the two evaluation bands to the two transfer functions defined in the Common Clock Architecture and reporting the worst case results for each evaluation band. Maximum limit for PCI Express Generation 2 is 3.1ps RMS for tREFCLK_HF_RMS (High Band) and 3.0ps RMS for tREFCLK_LF_RMS (Low Band).
3. RMS jitter after applying system transfer function for the common clock architecture. This specification is based on the PCI_Express_Base_r3.0 10 Nov, 2010 specification, and is subject to change pending the final release version of the specification.
4. This parameter is guaranteed by characterization. Not tested in production.

Marking Diagrams

Notes:

1. Line 1 is the truncated part number.
2. "-000" denotes blank part.
3. "-ddd" denotes dash code.
4. "YYW" is the last digit of the year and week that the part was assembled.
5. "***" is the lot sequence number.
6. "\$" is the assembler mark code.
