*LM3940 1A Low Dropout Regulator for 5V to 3.3V Conversion*

Literature Number: SNVS114D

# LM3940

## 1A Low Dropout Regulator for 5V to 3.3V Conversion

### General Description

The LM3940 is a 1A low dropout regulator designed to provide 3.3V from a 5V supply.

The LM3940 is ideally suited for systems which contain both 5V and 3.3V logic, with prime power provided from a 5V bus. Because the LM3940 is a true low dropout regulator, it can hold its 3.3V output in regulation with input voltages as low as 4.5V.

The TO-220 package of the LM3940 means that in most applications the full 1A of load current can be delivered without using an additional heatsink.

The surface mount TO-263 package uses minimum board space, and gives excellent power dissipation capability when soldered to a copper plane on the PC board.

### Features

- Output voltage specified over temperature
- Excellent load regulation
- Guaranteed 1A output current
- Requires only one external component
- Built-in protection against excess temperature
- Short circuit protected

### Applications

- Laptop/Desktop Computers
- Logic Systems

### Typical Application

1208001

\*Required if regulator is located more than 1' from the power supply filter capacitor or if battery power is used.

\*\*See Application Hints.

**Absolute Maximum Ratings** (Note 1)

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

Storage Temperature Range	-65°C to +150°C
Lead Temperature (Soldering, 5 seconds)	260°C
Power Dissipation (Note 2)	Internally Limited

Input Supply Voltage	7.5V
ESD Rating (Note 3)	2 kV

**Operating Ratings** (Note 1)

Junction Temperature Range, $T_J$	-40°C to +125°C
Input Supply Voltage, $V_{IN(MIN)}$	$V_O + V_{DO}$

**Electrical Characteristics**

Limits in standard typeface are for  $T_J = 25^\circ\text{C}$ , and limits in **boldface type** apply over the full operating temperature range. Unless otherwise specified:  $V_{IN} = 5\text{V}$ ,  $I_L = 1\text{A}$ ,  $C_{OUT} = 33\ \mu\text{F}$ .

Symbol	Parameter	Conditions	Typical	LM3940 (Note 4)		Units
				min	max	
$V_O$	Output Voltage	$5\text{ mA} \leq I_L \leq 1\text{ A}$	3.3	3.20 <b>3.13</b>	3.40 <b>3.47</b>	V
$\frac{\Delta V_O}{\Delta V_I}$	Line Regulation	$I_L = 5\text{ mA}$ $4.5\text{ V} \leq V_{IN} \leq 5.5\text{ V}$	20		40	mV
$\frac{\Delta V_O}{I_L}$	Load Regulation	$50\text{ mA} \leq I_L \leq 1\text{ A}$	35		50 <b>80</b>	
$Z_O$	Output Impedance	$I_L(\text{DC}) = 100\text{ mA}$ $I_L(\text{AC}) = 20\text{ mA (rms)}$ $f = 120\text{ Hz}$	35			m $\Omega$
$I_Q$	Quiescent Current	$4.5\text{ V} \leq V_{IN} \leq 5.5\text{ V}$ $I_L = 5\text{ mA}$	10		15 <b>20</b>	mA
		$V_{IN} = 5\text{ V}$ $I_L = 1\text{ A}$	110		200 <b>250</b>	
$e_n$	Output Noise Voltage	$\text{BW} = 10\text{ Hz} - 100\text{ kHz}$ $I_L = 5\text{ mA}$	150			$\mu\text{V (rms)}$
$V_{DO}$	Dropout Voltage (Note 5)	$I_L = 1\text{ A}$	0.5		0.8 <b>1.0</b>	V
		$I_L = 100\text{ mA}$	110		150 <b>200</b>	mV
$I_L(\text{SC})$	Short Circuit Current	$R_L = 0$	1.7	1.2		A

**Thermal Performance**

Thermal Resistance Junction-to-Case, $\theta_{JC}$	3-Lead TO-220	4		$^\circ\text{C/W}$
	3-Lead TO-263	4		$^\circ\text{C/W}$
	8-Lead LLP	6		$^\circ\text{C/W}$
Thermal Resistance Junction-to-Ambient, $\theta_{JA}$	3-Lead TO-220	60		$^\circ\text{C/W}$
	3-Lead TO-263	80		$^\circ\text{C/W}$
	8-Lead LLP (Note 2)	35		$^\circ\text{C/W}$

**Note 1:** Absolute maximum ratings indicate limits beyond which damage to the component may occur. Electrical specifications do not apply when operating the device outside of its rated operating conditions.

**Note 2:** The maximum allowable power dissipation is a function of the maximum junction temperature,  $T_J$ , the junction-to-ambient thermal resistance,  $\theta_{JA}$ , and the ambient temperature,  $T_A$ . Exceeding the maximum allowable power dissipation will cause excessive die temperature, and the regulator will go into thermal shutdown. The value of  $\theta_{JA}$  (for devices in still air with no heatsink) is  $60^\circ\text{C/W}$  for the TO-220 package,  $80^\circ\text{C/W}$  for the TO-263 package, and  $174^\circ\text{C/W}$  for the SOT-223 package. The effective value of  $\theta_{JA}$  can be reduced by using a heatsink (see Application Hints for specific information on heatsinking). The value of  $\theta_{JA}$  for the LLP package is specifically dependant on PCB trace area, trace material, and the number of layers and thermal vias. For improved thermal resistance and power dissipation for the LLP package, refer to Application Note AN-1187. The  $\theta_{JA}$  rating for the LLP is with a JESD51-7 test board having 6 thermal vias under the exposed pad.

**Note 3:** ESD rating is based on the human body model: 100 pF discharged through 1.5 k $\Omega$ .

**Note 4:** All limits guaranteed for  $T_J = 25^\circ\text{C}$  are 100% tested and are used to calculate Outgoing Quality Levels. All limits at temperature extremes are guaranteed via correlation using standard Statistical Quality Control (SQC) methods.

**Note 5:** Dropout voltage is defined as the input-output differential voltage where the regulator output drops to a value that is 100 mV below the value that is measured at  $V_{IN} = 5\text{V}$ .

## Application Hints

### EXTERNAL CAPACITORS

The output capacitor is critical to maintaining regulator stability, and must meet the required conditions for both ESR (Equivalent Series Resistance) and minimum amount of capacitance.

#### MINIMUM CAPACITANCE:

The minimum output capacitance required to maintain stability is 33  $\mu\text{F}$  (this value may be increased without limit). Larger values of output capacitance will give improved transient response.

#### ESR LIMITS:

The ESR of the output capacitor will cause loop instability if it is too high or too low. The acceptable range of ESR plotted versus load current is shown in the graph below. **It is essential that the output capacitor meet these requirements, or oscillations can result.**

FIGURE 1. ESR Limits

It is important to note that for most capacitors, ESR is specified only at room temperature. However, the designer must ensure that the ESR will stay inside the limits shown over the entire operating temperature range for the design.

For aluminum electrolytic capacitors, ESR will increase by about 30X as the temperature is reduced from 25°C to -40°C. This type of capacitor is not well-suited for low temperature operation.

Solid tantalum capacitors have a more stable ESR over temperature, but are more expensive than aluminum electrolytics. A cost-effective approach sometimes used is to parallel an aluminum electrolytic with a solid Tantalum, with the total capacitance split about 75/25% with the Aluminum being the larger value.

If two capacitors are paralleled, the effective ESR is the parallel of the two individual values. The “flatter” ESR of the Tantalum will keep the effective ESR from rising as quickly at low temperatures.

### HEATSINKING

A heatsink may be required depending on the maximum power dissipation and maximum ambient temperature of the application. Under all possible operating conditions, the junction temperature must be within the range specified under Absolute Maximum Ratings.

To determine if a heatsink is required, the power dissipated by the regulator,  $P_D$ , must be calculated.

The figure below shows the voltages and currents which are present in the circuit, as well as the formula for calculating the power dissipated in the regulator:

$$I_{IN} = I_L + I_G$$

$$P_D = (V_{IN} - V_{OUT}) I_L + (V_{IN}) I_G$$

FIGURE 2. Power Dissipation Diagram

The next parameter which must be calculated is the maximum allowable temperature rise,  $T_R$  (max). This is calculated by using the formula:

$$T_R (\text{max}) = T_J (\text{max}) - T_A (\text{max})$$

**Where:**  $T_J$  (max) is the maximum allowable junction temperature, which is 125°C for commercial grade parts.

$T_A$  (max) is the maximum ambient temperature which will be encountered in the application.

Using the calculated values for  $T_R$ (max) and  $P_D$ , the maximum allowable value for the junction-to-ambient thermal resistance,  $\theta_{(JA)}$ , can now be found:

$$\theta_{(JA)} = T_R (\text{max})/P_D$$

**IMPORTANT:** If the maximum allowable value for  $\theta_{(JA)}$  is found to be  $\geq 60^\circ\text{C/W}$  for the TO-220 package,  $\geq 80^\circ\text{C/W}$  for the TO-263 package, or  $\geq 174^\circ\text{C/W}$  for the SOT-223 package, no heatsink is needed since the package alone will dissipate enough heat to satisfy these requirements.

If the calculated value for  $\theta_{(JA)}$  falls below these limits, a heatsink is required.

### HEATSINKING TO-220 PACKAGE PARTS

The TO-220 can be attached to a typical heatsink, or secured to a copper plane on a PC board. If a copper plane is to be used, the values of  $\theta_{(JA)}$  will be the same as shown in the next section for the TO-263.

If a manufactured heatsink is to be selected, the value of heatsink-to-ambient thermal resistance,  $\theta_{(H-A)}$ , must first be calculated:

$$\theta_{(H-A)} = \theta_{(JA)} - \theta_{(C-H)} - \theta_{(J-C)}$$

**Where:**  $\theta_{(J-C)}$  is defined as the thermal resistance from the junction to the surface of the case. A value of 4°C/W can be assumed for  $\theta_{(J-C)}$  for this calculation.

$\theta_{(C-H)}$  is defined as the thermal resistance between the case and the surface of the heatsink. The value of  $\theta_{(C-H)}$  will vary from about 1.5°C/W to about 2.5°C/W (depending on method of attachment, insulator, etc.). If the exact value is unknown, 2°C/W should be assumed for  $\theta_{(C-H)}$ .

When a value for  $\theta_{(H-A)}$  is found using the equation shown, a heatsink must be selected that has a value that is less than or equal to this number.

$\theta_{(H-A)}$  is specified numerically by the heatsink manufacturer in the catalog, or shown in a curve that plots temperature rise vs. power dissipation for the heatsink.

**HEATSINKING TO-263 AND SOT-223 PACKAGE PARTS**

Both the TO-263 (“S”) and SOT-223 (“MP”) packages use a copper plane on the PCB and the PCB itself as a heatsink. To optimize the heat sinking ability of the plane and PCB, solder the tab of the package to the plane.

Figure 3 shows for the TO-263 the measured values of  $\theta_{(JA)}$  for different copper area sizes using a typical PCB with 1 ounce copper and no solder mask over the copper area used for heatsinking.

**FIGURE 3.  $\theta_{(JA)}$  vs. Copper (1 ounce) Area for the TO-263 Package**

As shown in the figure, increasing the copper area beyond 1 square inch produces very little improvement. It should also be observed that the minimum value of  $\theta_{(JA)}$  for the TO-263 package mounted to a PCB is 32°C/W.

As a design aid, Figure 4 shows the maximum allowable power dissipation compared to ambient temperature for the TO-263 device (assuming  $\theta_{(JA)}$  is 35°C/W and the maximum junction temperature is 125°C).

**FIGURE 4. Maximum Power Dissipation vs.  $T_{AMB}$  for the TO-263 Package**

Figure 5 and Figure 6 show the information for the SOT-223 package. Figure 6 assumes a  $\theta_{(JA)}$  of 74°C/W for 1 ounce copper and 51°C/W for 2 ounce copper and a maximum junction temperature of 125°C.

**FIGURE 5.  $\theta_{(JA)}$  vs. Copper (2 ounce) Area for the SOT-223 Package**

**FIGURE 6. Maximum Power Dissipation vs.  $T_{AMB}$  for the SOT-223 Package**

Please see AN1028 for power enhancement techniques to be used with the SOT-223 package.

### LIFE SUPPORT POLICY

**NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS PRIOR WRITTEN APPROVAL OF THE CHIEF EXECUTIVE OFFICER AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION.** As used herein:

Life support devices or systems are devices which (a) are intended for surgical implant into the body, or (b) support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labeling can be reasonably expected to result in a significant injury to the user. A critical component is any component in a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system or to affect its safety or effectiveness.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
