

## FEATURES

- 14V/μs Slew Rate: 10V/μs Min
- 5MHz Gain-Bandwidth Product
- Fast Settling Time: 1.3μs to 0.02%
- 150μV Offset Voltage (LT1057): 450μV Max
- 180μV Offset Voltage (LT1058): 600μV Max
- 2μV/°C  $V_{OS}$  Drift: 7μV/°C Max
- 50pA Bias Current at 70°C
- Low Voltage Noise:
  - 13nV/√Hz at 1kHz
  - 26nV/√Hz at 10Hz

## APPLICATIONS

- Precision, High Speed Instrumentation
- Fast, Precision Sample-and-Hold
- Logarithmic Amplifiers
- D/A Output Amplifiers
- Photodiode Amplifiers
- Voltage-to-Frequency Converters
- Frequency-to-Voltage Converters

## DESCRIPTION

The LT<sup>®</sup>1057 is a matched JFET input dual op amp in the industry standard 8-pin configuration, featuring a combination of outstanding high speed and precision specifications. It replaces all the popular bipolar and JFET input dual op amps. In particular, the LT1057 upgrades the performance of systems using the LF412A and OP-215 JFET input duals.

The LT1058 is the lowest offset quad JFET input operational amplifier in the standard 14-pin configuration. It offers significant accuracy improvement over presently available JFET input quad operational amplifiers. The LT1058 can replace four single precision JFET input op amps, while saving board space, power dissipation and cost.

Both the LT1057 and LT1058 are available in the plastic PDIP package and the surface mount SO package.

LT, LT, LTC and LTM are registered trademarks of Linear Technology Corporation. All other trademarks are the property of their respective owners.

## TYPICAL APPLICATION

**Current Output, High Speed, High Input Impedance  
Instrumentation Amplifier**

\*GAIN ADJUST

**Note 1:** Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.

**Note 2:** Typical parameters are defined as the 60% yield of distributions of individual amplifiers; (i.e., out of 100 LT1058s or 100 LT1057s, typically 240 op amps, or 120 for the LT1057, will be better than the indicated specification).

**Note 3:** This parameter is tested on a sample basis only.

**Note 4:** Current noise is calculated from the formula:

$$i_n = (2qI_b)^{1/2}$$

where  $q = 1.6 \cdot 10^{-19}$  coulomb. The noise of source resistors up to 1G swamps the contribution of current noise.

**Note 5:** This parameter is not 100% tested.

**Note 6:** Gain-bandwidth product is not tested. It is guaranteed by design and by inference from the slew rate measurement.

**APPLICATIONS INFORMATION**

The LT1057 may be inserted directly in LF353, LF412, LF442, TL072, TL082 and OP-215 sockets. The LT1058 plugs into LF347, LF444, TL074 and TL084 sockets. Of course, all standard dual and quad bipolar op amps can also be replaced by these devices.

**High Speed Operation**

When the feedback around the op amp is resistive ( $R_F$ ) a pole will be created with  $R_F$ , the source resistance and capacitance ( $R_S$ ,  $C_S$ ), and the amplifier input capacitance ( $C_{IN} \approx 4\text{pF}$ ). In low closed loop gain configurations and

with  $R_S$  and  $R_F$  in the kilohm range, this pole can create excess phase shift and even oscillation. A small capacitor ( $C_F$ ) in parallel with  $R_F$  eliminates this problem. With  $R_S(C_S + C_{IN}) = R_F C_F$ , the effect of the feedback pole is completely removed.

## APPLICATIONS INFORMATION

Settling time is measured in a test circuit which can be found in the LT1055/LT1056 data sheet and in Application Note 10.

### Achieving Picoampere/Microvolt Performance

In order to realize the picoampere/microvolt level accuracy of the LT1057/LT1058, proper care must be exercised. For example, leakage currents in circuitry external to the op amp can significantly degrade performance. High quality insulation should be used (e.g., Teflon™, Kel-F); cleaning of all insulating surfaces to remove fluxes and other residues will probably be required. Surface coating may be necessary to provide a moisture barrier in high humidity environments.

Board leakage can be minimized by encircling the input circuitry with a guard ring operated at a potential close to that of the inputs; in inverting configurations, the guard ring should be tied to ground, in noninverting connections, to the inverting input. Guarding both sides of the printed circuit board is required. Bulk leakage reduction depends on the guard ring width.

The LT1057/LT1058 have the lowest offset voltage of any dual and quad JFET input op amps available today. However, the offset voltage and its drift with time and temperature are still not as good as on the best bipolar amplifiers (because the transconductance of FETs is considerably lower than that of bipolar transistors). Conversely, this lower transconductance is the main cause of the significantly faster speed performance of FET input op amps.

Offset voltage also changes somewhat with temperature cycling. The AM grades show a typical 40μV hysteresis (50μV on the M grades) when cycled over the -55°C to 125°C temperature range. Temperature cycling from 0°C to 70°C has a negligible (less than 20μV) hysteresis effect.

The offset voltage and drift performance are also affected by packaging. In the plastic N package, the molding compound is in direct contact with the chip, exerting pressure on the surface. While NPN input transistors are largely unaffected by this pressure, JFET device drift is degraded. Consequently for best drift performance, as shown in the Typical Performance Characteristics distribution plots, the J or H packages are recommended.

In applications where speed and picoampere bias currents are not necessary, Linear Technology offers the bipolar input, pin compatible LT1013 and LT1014 dual and quad op amps. These devices have significantly better DC specifications than any JFET input device.

### Phase Reversal Protection

Most industry standard JFET input single, dual and quad op amps (e.g., LF156, LF351, LF353, LF411, LF412, OP-15, OP-16, OP-215, TL084) exhibit phase reversal at the output when the negative common mode limit at the input is exceeded (i.e., below -12V with ±15V supplies). The photos below show a ±16V sine wave input (A), the response of an LF412A in the unity gain follower mode (B), and the response of the LT1057/LT1058 (C).

The phase reversal of photo (B) can cause lock-up in servo systems. The LT1057/LT1058 does not phase-reverse due to a unique phase reversal protection circuit.

Teflon is a trademark of DuPont.

## RELATED PARTS

PART NUMBER	DESCRIPTION	COMMENTS
LT1055/6	Precision, High Speed, JFET Input Operational Amplifiers	12V/ $\mu$ s Slew Rate, 5.5MHz Bandwidth
LT1880	SOT-23, Rail-to-Rail Output, Picoamp Input Precision Op Amps	150 $\mu$ V Max Offset Voltage, 900pA Max Input Bias Current
LT1881/2	Dual and Quad Rail-to-Rail Output, Picoamp Input Precision Op Amps	50 $\mu$ V Max Offset Voltage, 200pA Max Input Bias Current
LT1884/5	Dual/Quad Rail-to-Rail Output, Picoamp Input Precision Op Amps	50 $\mu$ V Max Offset Voltage, 400pA Max Input Bias Current
LT6010	135 $\mu$ A, 14nV/rtHz, Rail-to-Rail Output, Precision Low Power Op Amp with Shutdown	35 $\mu$ V Max Offset Voltage, 300pA Max Input Bias Current
LT6011/12	Dual/Quad 135 $\mu$ A, 14nV/rtHz, Rail-to-Rail Output Precision Low Power Op Amp	60 $\mu$ V Max Offset Voltage, 300pA Max Input Bias Current
LTC6078/9	Micropower Precision, Dual/Quad CMOS Rail-to-Rail Input/Output Amplifiers	Maximum Offset Drift: 0.7 $\mu$ V/ $^\circ$ C
LTC6241/2	Dual/Quad 18MHz, Low Noise, Rail-to-Rail CMOS Op Amps	0.1Hz to 10Hz Noise: 550n Vpp
